

Angle Bending Diffusers

A-Series Angle Bending (Asymmetric Direction Turning) Diffusers

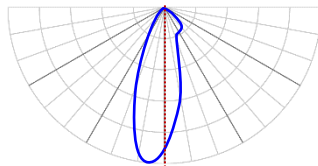

A-Series diffusers provide an elegant solution for wall-wash, sign illumination, and specialty applications, providing an angle bend to direct the light toward a wall or surface, combined with a simultaneous cross-wall diffusion, to eliminate scalloping and increase uniformity.

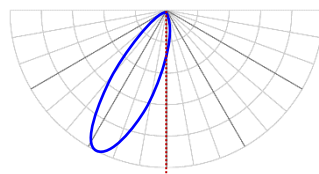

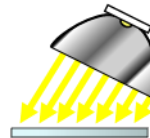

Wide Illumination

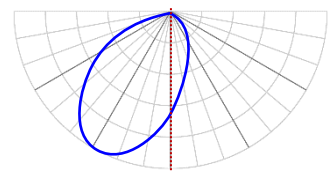

Narrow Down Illumination

Narrow Angled Illumination

Medium Angled Illumination

Usage Notes:

- A-Series diffusers are generally used with the microstructures facing *toward* the LEDs or lamps
- They have highest performance when used with collimated or narrow (up to 30 degrees) input beams, such as an LED with TIR lens or parabolic reflector
- The diffuser may be tilted relative to the input beam to fine tune the angle and light profile
- Other angles and spreads are available on a custom basis
- Bright View applications engineers can assist with product choices and help your design achieve peak performance

Angles data are typical; they vary greatly depending on luminaire design.
